

# UdaPeople CI/CD

Mathew Mwangi

# About

As we plan to introduce Udapeople to our a large base of our customers it is critical that we get it right form the beginning. This presentation seeks to exactly show how we will achieve that as an organization

# PROBLEMS WITHOUT CI/CD

## REVENUE LEAKAGE

Incase we have a failed deployment it becomes a tedious task to revert to the last working version and in the process we loose revenue and also destroy our reputation

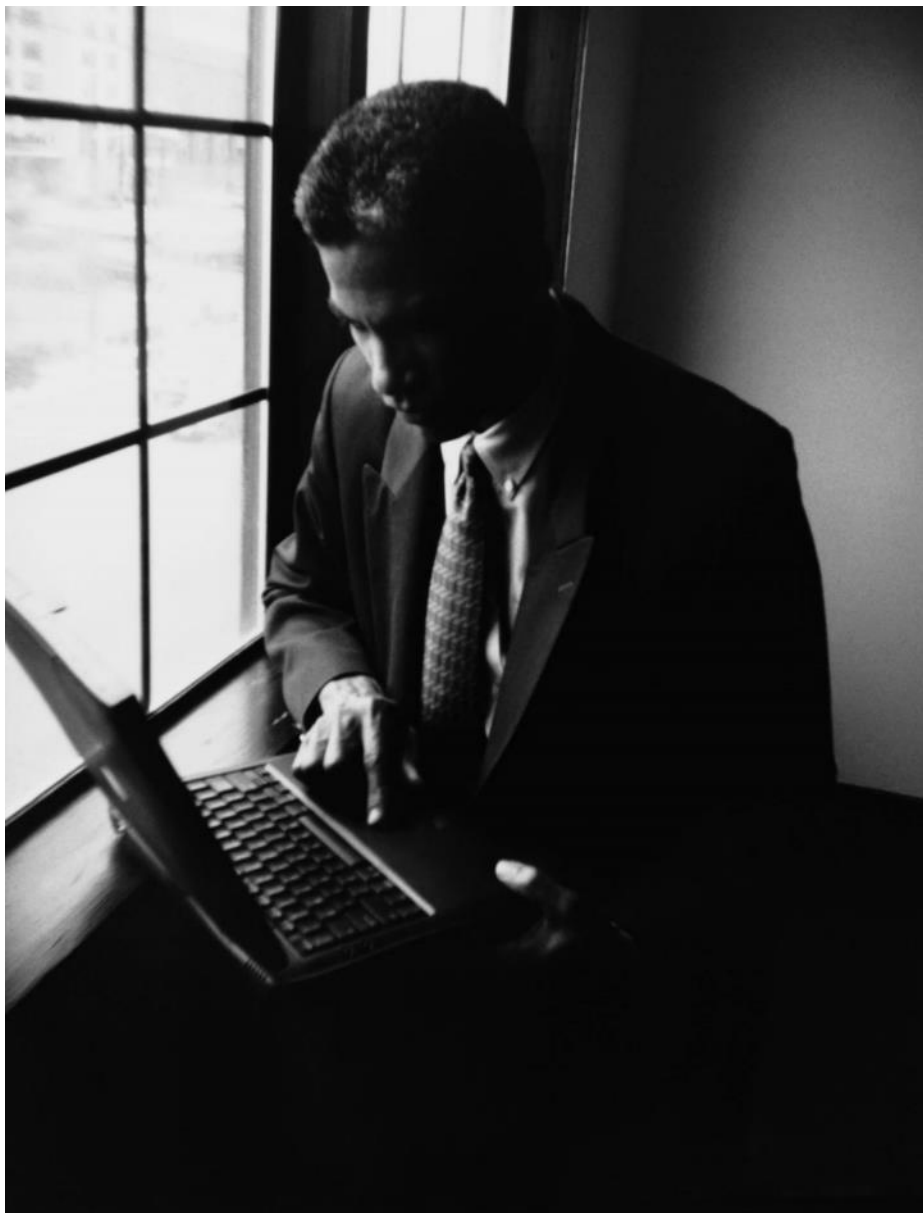

## REDUCED REVENUE

Takes time before we get to the market for our customers to use our new features making us lag behind our competitors

## HUMAN ERROR

As human we are prone to mistakes which can be devastating to the business such as downtimes

# SOLUTION

## PROTECT REVENUE

With this implementation there will be reduced downtime from a deploy-related crash or major bug saving the organization thousands of dollars.

## INCREASE REVENUE

There will be a significant time spend on releasing new features to the market and frequent deployments

## REDUCED COSTS

Any unused infrastructure will be monitored and scaled down to reduce our costs

## AVOID COSTS

Human errors will be significantly reduced translating to reduced incidents.
